

ABSTRACT

Before shaving with shaver SPR with fixed protection cap uniform layer of shaving foam is spread on the face through cracks and cross ribbing. Shaving foam flow is the same without using the protection cap therefore the nature of the shaver SPR will be described in shaving.

By turning the regulator (3) the screwing (7) pushes down the standard stopper (4) of a spray with pressurised shaving foam (8). The foam flows through the hollow duct (5) of the cutter block (6) into cracks and ends in front of the second cutting edge (2) and then on the face. (Before shaving further over the protection cap.) The first cutting edge (1) together with the shaving foam spread on the face before shaving trims maximum of a hair in the same way. At the same time the second cutting edge (2) plus shaving foam squeezed on the face trims the rest of a hair and that is expelled (flows) through the cutter block (6) side holes (10) under shaving foam pressure. The cutter block (6) side holes (10) are covered when the protection cap (9) is put on.
